OR

# MULTIPLICATION TABLES OF DECIMAL FRACTIONS. 

By Henry B. Hedrick, Ph. D.<br>INTRODUCTION.

These tables are of especial use in any and all problems involving the multiplication of decimal fractions of two or three digits where the product is required to no more significant figures than are contained in the smaller factor. As set forth later under the heading, Explanation of the Tables, their use may readily be extended to decimal fractions of three and four digits. They are thus of value for many computations in engineering, in military, naval, astronomical, and physical sciences, or wherever the slide-rule, graphical methods, or three or four-place logarithms are ordinarily employed. They are more accurate than the slide-rule or graphical methods, and far more convenient to use than logarithms.

For the multiplication of whole numbers of two or three figures such tables as those of Crelle or of Cotsworth are well adapted, but where one of the factors is a decimal fraction given only to a certain degree of accuracy or to a certain number of decimal places and the product is desired to the same accuracy, the present tables are more convenient. They give the desired product directly to the nearest unit as far as needed, requiring no pointing off nor consequent adjustment of the last figure. They give only the first one of the consecutive numbers from which the same product results, thus making their use easier and more rapid not only for cases where one factor remains constant for a series of multiplications, but also where both factors vary. On examining several well-used copies of Crelle's tables, it was very apparent that they were used mostly for the first 100 pages; in the present tables only 14 pages need be used to cover the same factors.

The arrangement of placing one factor in the top horizontal line, the second factor in a column immediately below, and the required product in the outside columns has many advantages. It permits the eye to travel in one continuous route, first in a column and then along a line to the desired product, instead of having to travel first in one direction and then in another in order to find the result at the intersection of a column and a line as is the case with other tables. The grouping in blocks of five aids in obtaining the product, since the position in the block indicates the unit figure, after a glance to the right or left has determined the block and the figure in the second or tens place.

These tables are constructed on the principle of multiplication by means of division by the reciprocal. Since one of the factors in interpolation is a fraction, or at least may be so considered, its reciprocal is a whole number or a whole number plus a fraction and, in consequence, the same quotient results from several successive values of the dividend. The smaller the fraction, the larger will be the reciprocal or divisor and the greater the change in the dividend for a unit change in the quotient. Advantage is taken of this fact to make the tables more compact and convenient by giving only the smallest value of the dividend from which will arise the desired quotient, or, in other words, by giving only the smallest of the several values of the second factor that will produce the required product. The products are given in the tables to the nearest unit. Where the discarded fraction is exactly a half, and two numbers are therefore equally near, one a half-unit too large and the other a half-unit too small, the even number is always given in the tables.

Most of the necessary computations in the preparation of the tables were performed by Mr. Benjamin M. Hedrick, Mr. Joseph F. Jackson, and Mr. Edmund S. Davenport.

## EXPLANATION OF THE TABLES.

Pages 1, 2, and 3 contain the products divided by 100 of each number from 1 to 99 by 1 to 100 . Pages 4 to 77 contain the products divided by 1000 of each number from 1 to 500 by 1 to 1000 . Pages 78 to 139 contain the products divided by 1000 of each number from 500 to 999 by all numbers up to 1000 , but beginning each table with a value of the second factor not greater than that of the first factor.

The first factor is given on the top horizontal line in clarendon type and is preceded by a decimal point. The number of digits after the decimal point indicate the power of ten by which the products are divided.

The second factor is given below in the body of the table in ordinary type. Only the first number of the series which produce the same product is given.

The required product, to the nearest unit, is given in the outside vertical column headed P , in bold-faced type. When the product is greater than 100 , its third digit (the number of hundreds) is given, also in bold-faced type, in the next to the top line, opposite the letter $P$.

To obtain the product we have the following:
Rule.-Find one factor among the numbers in the top line preceded by a decimal point. Either factor may be taken if both factors are less than 500 , but if one or both are greater than 500 , then find the smaller factor in the top line. In the column or columns below find the other factor or the number nearest to and smaller than the other factor; then on the same horizontal line with the number last found, either to the right or to the left, in the marginal columns headed $P$, is the required product, or the last two digits of the product when it is greater than a hundred; the number of hundreds in the product is found, opposite the letter $P$, in the next to the top line of the column in which is the second factor, or the number next smaller than the second factor.

Examples.-1. Required 16/100 of 29. Find 16 in the top line (section 1, page 1 ), under .16 find 29 , then to the right or left on the same horizontal line as 29 in the marginal column is 5 , the answer.

Or find .29 in the top line (section 2, page 1), under . 29 find 16, then in the marginal columns on the horizontal line with 16 is 5 , the answer.
2. Required $2.3 \times 8.9$ to the nearest unit. Find .23 in the top line, under .23 find 89 or the nearest number less than 89 , in this case 85 , then in the marginal columns on line with 85 is 20 , the required product.
3. Required $0.302 \times 441$. Find .302 on top line (page 33 ). In the column below the 100 we find 439 , the nearest number to 441 and smaller; and opposite 439 in the marginal columns is 33 , thus $0.302 \times 441=133$.

Or find .441 on top line (page 63). In the columns below is 301 -the nearest number smaller than 302 -and opposite 301 is 33 ; thus $.302 \times 441=133$.

The first three pages are intended for use where the factors are of two digits or less, but they may often be employed advantageously when one factor contains three digits, the other two digits and the product divided by a hundred is desired, by neglecting, at first, the third (or hundreds) digit and adding the partial product thus obtained from the tables to the product of the third digit by the factor of two digits. This is especially convenient when the third digit is unity, in which case the product from the tables is added to the two-digit factor to obtain the required product.

All the tables on the first page are given later extended ten times under the same heading but with a cipher attached. Thus on page 1 is given the table for 26 hundredths of all numbers from 1 to 100 , while on page 26 there is given the table for 260 thousandths (same as 26 hundredths) of all numbers from 1 to 1000 .

Pages 4 to the end are intended for use where the factors are of three digits or less, but they may often be employed advantageously when one factor contains four digits by neglecting, at first, the fourth-or thousands-digit and adding the partial product thus obtained from the tables to the product of the fourth digit by the factor of three digits. For example, let it be required to find how many feet are in 268 thousandths of a mile.

$$
.268 \times 5280=5 \times 268+280 \times .268=1340+75=1415
$$

It is especially convenient when the fourth digit is unity, in which case the product from the tables is added to the three-digit factor to obtain the required product.

Example: 0.302 times 1227. At first neglect the 1 in 1227. Under .302 in the top line find 227 or the nearest number to 227 and smaller, in this case 227, and opposite 227 is 69 . Then $.302 \times 1227=69+302=371$.

## INTERPOLATION.

Mathematical tables give values of the function for certain values of the variable argument. Values of this function corresponding to intermediate values of the argument are obtained by the process known as interpolation. The consecutive given values of the argument usually differ by a constant quantity; if this difference be regarded as unity, an intermediate value of the argument will differ from the given value on either side by a fraction. In the process of interpolation it is necessary to obtain the product of this fraction by the proper variation of the function. By means of the present tables this product may be obtained in a most rapid and accurate manner when the numbers involved are of three digits or less. The variation to be used may be given directly or it can be derived from the given values of the function in the manner explained below.

Let the quantities be denoted by the following scheme:

| Argument. | Table. | 1 st difference. | $2 d$ <br> difference. | $\begin{gathered} 3 \mathrm{~d} \\ \text { difference. } \end{gathered}$ | 4th difference |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\alpha_{-2}$ | $f\left(\alpha_{\sim 2}\right)$ |  | $\Delta^{\text {ii }}{ }_{2}$ |  | $\Delta^{\text {iv }}$ |
| $\alpha_{-1}$ | $f\left(\alpha_{-1}\right)$ |  | $\Delta^{\text {ii }}{ }_{1}$ |  | $\Delta_{1}^{\text {iv }}$ |
| $\alpha_{0}$ | $f\left(\alpha_{0}\right)$ | $\Delta^{\mathrm{i}}{ }_{1 / 2}$ | $\Delta_{i j}^{i j}$ | $\Delta_{\text {iii }}^{\text {iid }}$ | $\Delta_{0}^{\text {iv }}$ |
| $\alpha_{0}$ |  | $\Delta_{1 / 2}$ |  | $\Delta_{\text {iij2 }}^{\text {iid }}$ |  |
| $\alpha_{1}$ | $f\left(\alpha_{1}\right)$ |  | $\Delta_{1}^{i i}$ |  | $\Delta_{1}^{\text {iv }}$ |
| $\alpha_{2}$ | $f\left(\alpha_{2}\right)$ | $\Delta_{3 / 2}$ | $\Delta_{2}^{\text {it }}$ | $\triangle_{3 / 2}$ | $\Delta_{2}^{\text {iv }}$ |

where
$\alpha_{0}$ denotes the argument from which the interpolation is made;
$\alpha_{-1}$, the preceding argument to $\alpha_{0}$;
$\alpha_{1}$, the following argument to $\alpha_{0}$;
$f\left(\alpha_{0}\right)$, the value of the function corresponding to $\alpha_{0}$;
$f\left(\alpha_{-1}\right)$, the value of the function corresponding to $\alpha_{-1}$;
$f\left(\alpha_{1}\right)$, the value of the function corresponding to $\alpha_{1}$;

$$
\begin{aligned}
& \Delta^{\mathrm{i}}{ }_{1 / 2}=f\left(\alpha_{0}\right)-f\left(\alpha_{1}\right) \text {, } \\
& \Delta_{1 / 2}^{\mathrm{i}}=f\left(\alpha_{1}\right)-f\left(\alpha_{0}\right), \\
& \Delta_{0}^{\mathrm{i}}=\Delta_{1 / 2}^{\mathrm{i}}-\Delta_{1 / 2}^{\mathrm{i}}, \quad \Delta_{1}^{\mathrm{i}}=\Delta_{3 / 2}^{\mathrm{i}}, \Delta_{1 / 2}^{\mathrm{i}} \text {, } \\
& \Delta_{1 / 2}^{\mathrm{iii}}=\Delta_{0}^{\mathrm{ii}}-\Delta^{\mathrm{ii}}, \quad \quad \Delta_{1 / 2}^{\mathrm{iii}}=\Delta_{1}^{\mathrm{ii}}-\Delta_{0}^{\mathrm{ii}}, \\
& \Delta_{0}^{\mathrm{iv}}=\Delta_{1 / 2}^{\mathrm{iii}}-\Delta_{-1 / 2}^{\mathrm{iii}}, \quad \Delta_{1}^{\mathrm{i}}=\Delta_{3 / 2}^{\mathrm{iii}}-\Delta_{1 / 2}^{\mathrm{iii}} .
\end{aligned}
$$

Let
$\alpha$ denote the value of the argument for which, $f(\alpha)$, the value of the function, is to be derived by interpolation;
$h=\alpha_{0}-\alpha_{1}=\alpha_{1}-\alpha_{0}$, etc., the common difference of the argument;
$n=\frac{\alpha-\alpha_{0}}{h}$, the interpolation factor;
$v$, the proper variation obtained from the differences by some one of the formulæ given below, the formula applicable in each example being determined by the numerical size of $n$ and of the various differences.

Then the formula of interpolation is

$$
f(\alpha)=f\left(\alpha_{0}\right)+n v
$$

Case 1. When $\left|\Delta^{\mathrm{ii}}\right|<4$ or $<\frac{1}{n(1-n)}$ we have

$$
v=\Delta_{1 / 2}^{\mathrm{i}} \text { or } \Delta_{-1 / 2}^{\mathrm{i}}
$$

according as $n$ is positive or negative, that is, according as $\alpha$ follows or precedes $\alpha_{0}$.
This case occurs more often than any other, since mathematical tables, especially those most frequently used, generally are so extended that the second differences are numerically less than four in units of the last place and thus may be neglected, as the error so caused never amounts to half a unit in the last place, a permissible error in interpolation. The maximum error from omission of $\Delta^{\mathrm{ii}}$ occurs when $n=1 / 2$, and the more $n$ differs from a half, either less than or greater than, the larger the second differences may be and still be neglected. The interpolation factor $n$ may have any value less than unity, so far as accuracy is concerned. Still the smaller the value of $n$ the easier, usually, the interpolation, so that even in this case it is advisable to interpolate from the nearest given value, thus making $n$ less than a half and either positive or negative. All the remaining cases which are mentioned below, except Case 7, are for interpolation from the nearest given value. This is not only advisable in order to render $n$ smaller, but necessary on account of neglecting part of the effects of higher differences, which would cause appreciable error for values of $n$ greater than a half.

Case 2. When $|n|<\frac{1}{2}$ and $\left|\Delta^{\mathrm{ii}}\right|<4$ or $<\frac{1}{n^{2}}$ we have

$$
v=\frac{\Delta_{-1 / 2}^{\mathrm{i}}+\Delta_{1 / 2}^{\mathrm{i}}}{2}=\Delta_{0}^{\mathrm{i}}
$$

For all values of $n$ numerically less than a half this formula is more accurate than that under Case 1 in regard to neglecting second differences and the advantage increases as $n$ decreases. Also the smaller the value of $n$ the larger the second differences may be and still be neglected without sensible error.

CASE 3. When $\left|\Delta^{i i}\right|>\frac{1}{n^{2}}$ and $\left|\Delta^{\text {iii }}\right|<6$ or $<\frac{3}{n}$ we have

$$
v=\frac{\Delta_{-1 / 2}^{\mathrm{i}}+\Delta_{1 / 2}^{\mathrm{i}}}{2}+n \frac{\Delta_{0}^{\mathrm{ii}}}{2}=\Delta_{0}^{\mathrm{i}}+n \frac{\Delta_{0}^{\mathrm{ii}}}{2}
$$

This formula is rigorous as far as second differences and should be used whenever second differences are too large for Case 2 and third differences are sufficiently small to be neglected. In application, the value of $\Delta_{0}^{i}$ may be formed and written on a line with and after $\Delta_{0}^{\mathrm{ii}}$; then, entering the table for $n$, take out $n \frac{\Delta_{0}^{\mathrm{ii}}}{2}$, add it to $\Delta_{0}^{i}$ to form $v$, and then, using the same table, obtain the value of $n v$, which is added to $f\left(\alpha_{0}\right)$ to obtain $f(\alpha)$.
CASE 4. When $\left|\Delta^{\text {iii }}\right|<24$ or $<\frac{3}{n^{3}}$ and $\left|\Delta_{0}^{\text {iv }}\right|<48$ or $<\frac{12}{n^{2}}$ we have

$$
v=\frac{\Delta_{1 / 2}^{\mathrm{i}}+\Delta_{1 / 2}^{\mathrm{i}}}{2}-\frac{1}{6} \frac{\Delta_{1 / 2}^{\mathrm{iii}}+\Delta_{-1 / 2}^{\mathrm{iii}}}{2}+n \frac{\Delta_{0}^{\mathrm{ii}}}{2}=\Delta_{0}^{\mathrm{i}}-\frac{\Delta_{0}^{\mathrm{iii}}}{6}+n \frac{\Delta_{0}^{\mathrm{ii}}}{2} .
$$

This formula includes the larger part of the effect of third differences. The remaining part is $1 / 6 n^{3} \Delta_{0}^{\mathrm{iii}}$ and therefore decreases with the cube of $n$.
Case 5. When $\left|\Delta^{\mathrm{iii}}\right|<\frac{3}{n^{3}}$ and $\left|\Delta_{0}^{\mathrm{iv}}\right|<192$ or $<\frac{12}{n^{4}}$ we have

$$
v=\Delta_{0}^{\mathrm{i}}-\frac{\Delta_{0}^{\mathrm{iii}}}{6}+n\left(\frac{\Delta_{0}^{\mathrm{ii}}}{2}-\frac{\Delta_{0}^{\mathrm{iv}}}{24}\right) .
$$

This formula includes the larger part of the effect of fourth differences. It includes the same part of the effect of third differences as Case 4, so the remarks there made apply as well to this case.

Case 6. When $\left|\Delta_{0}^{\text {iv }}\right|<192$ or $<\frac{12}{n^{4}}$ and $\left|\Delta^{v}\right|<96$ or $<\frac{12}{n^{3}}$ we have

$$
v=\Delta_{0}^{\mathrm{i}}-\frac{\Delta_{\mathrm{ij}}^{\mathrm{iij}}}{6}+\frac{\Delta_{0}^{v}}{30}+n\left(\frac{\Delta_{0}^{\mathrm{ii}}}{2}-\frac{\Delta_{0}^{\mathrm{iv}}}{24}+n \frac{\Delta_{\mathrm{o}}^{\mathrm{ii}}}{6}\right) .
$$

This formula is rigorous as far as third differences and includes the larger part of the effects of fourth and fifth differences. Very seldom will the differences be so large that the employment of this formula would produce appreciable error.

The advantages of the above formulæ over the usual forms are that the same interpolation factor is used throughout, that they are more rigorous without requiring the computation to be carried to extra decimal places, and that higher differences may be neglected when $n$ is small.

For the sake of completeness there is appended the following formula which includes the entire effect of all differences as high as the fifth and is rigorous for all values of $n$ and from which the preceding approximate formulæ are derived.

$$
v=\Delta_{0}^{\mathrm{i}}-\frac{\Delta_{0}^{\mathrm{iii}}}{6}+\frac{\Delta_{0}^{\mathrm{v}}}{30}+n\left\{\frac{\Delta_{0}^{\mathrm{ii}}}{2}-\frac{\Delta_{0}^{\mathrm{iv}}}{24}+n\left[\frac{\Delta_{0}^{\mathrm{ii}}}{6}-\frac{\Delta_{0}^{\mathrm{v}}}{24}+n\left(\frac{\Delta_{0}^{\mathrm{iv}}}{24}+n \frac{\Delta_{0}^{\mathrm{v}}}{120}\right)\right]\right\}
$$

When the differences of the third or higher order are large and $n$ is between $1 / 3$ and $2 / 3$ it is often expedient to interpolate first to halves, thus reducing both the size of the differences and of $n$ and bringing the final interpolation under a simpler case. For interpolation to halves we have, as far as fifth differences, the formula

$$
f\left(\alpha_{0}+\frac{h}{2}\right)=f\left(\alpha_{0}\right)+\frac{\Delta_{1 / 2}^{\mathrm{i}}}{2}-\frac{1}{8} \frac{\Delta_{0}^{\mathrm{ii}}+\Delta_{1}^{\mathrm{ii}}}{2}+\frac{3}{128} \frac{\Delta_{0}^{\mathrm{iv}}+\Delta_{1}^{\mathrm{iv}}}{2} .
$$

To express the final interpolation in terms of the original values of the function and differences, let
$\nu$ denote the new interpolation factor, $\quad \gamma$, the new proper variation,

$$
\Delta_{i / 2}^{\mathrm{i} / 2}=\frac{\Delta_{0}^{\mathrm{ii}}+\Delta_{\mathrm{i}}^{\mathrm{ii}}}{2}, \quad \quad \Delta_{1 / 2}^{\mathrm{iv}}=\frac{\Delta_{0}^{\mathrm{iv}}+\Delta_{0}^{\mathrm{iv}}}{2} .
$$

Then our formula of interpolation becomes
where

$$
f(\alpha)=f\left(\alpha_{0}+\frac{h}{2}\right)+\nu \gamma
$$

$$
\nu=2 n-1
$$

and the proper variation, $\gamma$, is formed from the formula below, using such differences as may be sensible.
Case 7. When $\frac{1}{3}<|n|<\frac{2}{3}$, and $\left|\Delta^{\text {iii }}\right|<216$ we have

$$
\gamma=\frac{\Delta_{\Delta_{1 / 2}}^{\mathrm{i}}}{2}-\frac{\Delta_{\mathrm{iin}_{1 / 2}}}{48}+\nu\left(\frac{\Delta_{1 / 2}^{\mathrm{i}}}{8}-\frac{3 \Delta_{1 \mathrm{iv}}^{\mathrm{iv}}}{128}\right)
$$

and in this case

$$
f(\alpha)=f\left(\alpha_{0}\right)+\frac{\Delta_{1 / 2}^{\mathrm{i}}}{2}-\frac{\Delta_{1 / 2}^{\mathrm{i}}}{8}+\frac{3 \Delta_{1 / 2}^{\mathrm{iv}}}{128} \times \nu \gamma .
$$

## EXAMPLES OF INTERPOLATION.

1. Given the value of $\Sigma_{1}$ for $D=0,1,2,3 \ldots$ as stated below, to obtain from them the value of $\Sigma_{1}$ for $D=1.107,2.107,3.107$,
(From computation of Ephemeris of the Moon for 1923 from the new Tables of the Moon published by the Yale University Press.)

| D | $\Sigma_{1}$ | $\Delta^{\text {i }}$ | $\Delta^{\text {ii }}$ | $\Delta^{\text {iii }}$ | $\Delta_{0}^{\mathrm{i}}$ | $n v$ | Result. |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | D | $\Sigma_{1}$ |
| 0 | 18348 |  |  |  | $v$ |  |  |  |
| 1 | 18265 | - 8. | +21 |  | - 72 | - 8 | 1.107 | 18257 |
| 2 | 18203 | - 62 | -14 | -35 | - 69 | - 7 | 2.107 | 18196 |
| 3 | 18127 |  | -32 | -18 | - 92 | -10 | 3.107 | 18117 |
| 4 | 18019 | -108 | -55 |  | -136 | -15 | 4.107 | 18004 |
| 5 | 17856 | -163 | -48 | + 7 | -187 | -20 | 5.107 | 17836 |
| 6 | 17645 | -211 |  |  |  |  |  |  |

## Here

$$
n=+.107, \frac{1}{n^{2}}=87 \text {. Since }\left|\Delta^{\mathrm{ii}}\right|<\frac{1}{n^{2}} \text {, we use Case } 2 \text { where } v=\Delta_{0}^{\mathrm{f}} \text {. }
$$

2. Given the values of $A(u)$ for $u=560,565,570$, to derive by interpolation the value of $A(u)$ for $u=562.7$. (From Handbook of Problems in Direct Fire, by Col. James M. Ingalls, example 4, page 13).

The form of computation is as follows:

| $u$ | $A(u)$ | $\Delta^{\mathrm{i}}$ | $\Delta_{0}^{\mathrm{ii}}$ | $\Delta_{0}^{\mathrm{i}}$ | $n \frac{\Delta_{0}^{\mathrm{if}}}{2}$ | $v$ | $n v$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & 560 \\ & 565 \\ & 570 \end{aligned}$ | 2724.3 $2620.0$ $2520.2$ | $\begin{aligned} & -104.3 \\ & -99.8 \end{aligned}$ | $+4.5$ | -102.0 | $-1.0$ | $-103.0$ | $+47.4$ |
| 562.7 | 2667.4 the answer. |  |  |  |  |  |  |

In the above computation,

$$
\begin{aligned}
& h=u_{0}-u_{-\mathrm{i}}=565-560=5, \\
& n=\frac{u-u_{0}}{h}=\frac{562.7-565}{5}=\frac{-2.3}{5}=-0.46, \quad \frac{1}{n^{2}}=\frac{1}{0.21}=5, \\
& \Delta_{0}^{\mathrm{i}}=\frac{\Delta_{-1 / 2}^{\mathrm{i}}+\Delta_{1 / 2}^{\mathrm{i}}}{2}=\frac{-104.3-99.8}{2}=\frac{-204.1}{2}-=-102.0, \\
& n \frac{\Delta^{\mathrm{ii}}}{2}=-0.46 \frac{+4.5}{2}=-0.46 \times+2.2=-1.0, \\
& v=\Delta_{0}^{\mathrm{i}}+n \frac{\Delta^{\mathrm{i}}}{2}=-102.0-1.0=-103.0, \\
& n v=-0.46 \times-103.0=+47.4, \\
& A(562.7)=A(565)+n v=2620.0+47.4=2667.4,
\end{aligned}
$$

using Case 3 , since the numerical value of $\Delta_{0}^{\mathrm{ii}}$, in units of the last place, is greater than $1 / n^{2}$; i.e. $45>5$.
3. Given the latitude of the Moon for every half day to find, by interpolation, the latitude for 1919 August $25^{\mathrm{d}} 3^{\mathrm{h}} 37^{\mathrm{m}}$ 1, the date of New Moon.

Taking the latitude of the moon from the American Ephemeris and differencing it we have:

| 1919, Aug. | Latitude. | $\Delta^{i}$ | $\Delta^{\mathrm{ii}}$ | $\Delta^{\text {iii }}$ | $\Delta^{\text {iv }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 24.0 | $-4^{\circ} 52^{\prime} 24^{\prime \prime} .1$ |  |  |  |  |
|  | $-45831$ |  |  |  |  |
| 24.5 | -4 5831.5 | $-156.8$ |  | $-5.5$ |  |
| 25.0 | $-5028.3$ |  | +4 5.1 |  | $-3.4$ |
| 25.5 | $-45820.0$ |  | $+356.2$ | $-8.9$ |  |
| 26.0 | $-45215.5$ | +64.5 |  |  |  |

whence

$$
n=\frac{\alpha-\alpha_{0}}{h}=\frac{3^{\mathrm{h}} 62}{12^{\mathrm{h}}}=+0.302, \quad \frac{3}{n^{3}}=109, \quad \frac{12}{n^{2}}=131 .
$$

Therefore $\left|\Delta^{\mathrm{iii}}\right|<\frac{3}{n^{3}}$ and $\left|\Delta^{\mathrm{i} v}\right|<\frac{12}{n^{2}}$; so we use Case 4 where

$$
v=\Delta_{0}^{\mathrm{i}}-\frac{\Delta_{0}^{\mathrm{iii}}}{6}+n \frac{\Delta_{0}^{\mathrm{ij}}}{2} .
$$

The compution is then as follows:

$$
\begin{aligned}
& n v=.302\left[\frac{-116.8+128.3}{2}+\frac{7.2}{6}+.302\left(\frac{245.1}{2}\right)\right] \\
& \\
& =.302[+5.8+1.2+.302(122.6)] \\
& \\
& \\
& \\
& =
\end{aligned}
$$

This problem may also be treated by Case 7, although $n$ is slightly outside the desirable limits. From the above data we derive

$$
\begin{aligned}
& \nu=2 n-1=-0.396 \\
& f\left(\alpha_{0}\right)=\text { Latitude Aug. } 25^{\circ} 0 \quad=-5^{\circ} 00^{\prime} 28^{\prime \prime} .3 \\
& \frac{\Delta_{1 / 2}^{1}}{2}=\frac{+128.3}{2} \\
& =+ \\
& 64.15 \\
& -\frac{\Delta_{1 / 2}^{\mathrm{i}}}{8}+\frac{3 \Delta_{1 / 2}^{\mathrm{iv}}}{128}=\frac{-240.6-0.6}{8}=-\quad 30.15 \\
& f\left(\alpha+\frac{h}{2}\right)=\text { Latitude Aug. } 25^{\mathrm{d}} 25=-4^{\circ} 59^{\prime} 54^{\prime \prime} .3 \\
& \begin{array}{ll}
\nu \gamma=-.396[64.2-.396(30.1)] & =-r \\
\text { Latitude Aug. } 25^{\mathrm{d}} 3^{\mathrm{n}} 37^{m} 1
\end{array} \begin{array}{l}
=-5^{\circ} 00^{\prime} 15.0
\end{array}
\end{aligned}
$$
